

North Dakota Surface Water Dependiant Public Water Systems

A public water system is defined as one which has at least 15 service connections or serves at least 25 people on a regular basis. Public water systems may be classified as "community" water systems or "non-community" water systems. Community water systems are typically cities, mobile home parks, or rural water systems. Non-community water systems may provide water to either a transient population (such as restaurants, campgrounds or truck stops) or a non-transient population (such as schools, manufacturing facilities, or power plants).

There may be additional systems present that are not represented on this map. Contact the city or the Health Department's Source Water Protection Program for more information.
